

Product Data Sheet

B-FINE 2001

Oxygen scavenger for low and medium pressure steam boilers

Technical Description	B-FINE 2001 is a blend of neutralized sulfite salts, carefully selected to react very quickly with dissolved oxygen.
Applications	B-FINE 2001 is a product designed to be used as an oxygen scavenger in low or medium pressure boiler feed water, regardless of the presence of thermal deaerator, in order to minimize pitting corrosion.
Dosing	B-FINE 2001 has to be fed continuously, by means of a dosing pump, into the make up water tank. If the system includes a thermal deaerator the best point for the application is immediately after the deaerator. The product can be fed concentrated or diluted with soft water or condensates, at any proportion. If it is to be diluted it is a good practice to prepare a daily dosing solution.
Packing	B-FINE 2001 is available in 25-Kg non-returnable polyethylene canisters. Other packing available on request.
Product benefits	Very effective and quick oxygen scavenging. Liquid product, easy to handle and use. Determination of product residual in boiler water is very easy and can be done "on site". All components of the product are FDA approved.
