

## Product Data Sheet

### **B-FINE 1150**

Dispersant Chemical Additive for Low and Medium Pressure Steam Boilers

#### **Technical Description**

The chemical additive B-FINE 1150 is a liquid product, based on specially selected organic dispersant polymers.

#### **Applications**

B-FINE 1150's dispersant action turns the product particularly effective for low and medium pressure boilers' water treatment. The product prevents scaling due to iron oxides and silica salts. By using regularly this product, the suspended solids remain in a fine dispersion and can be removed easily by the blow down.

#### **Packing**

B-FINE 1150 is available in 25-Kg non-returnable polyethylene canisters. Other packing available on request.

#### **Dosing**

The chemical additive B-FINE 1150 should be added continuously to the feed water tank or feed water pipe or directly inside the boiler, by a suitable dosing pump. The dose depends on the boiler's type, its manufacturer's specifications and the suspended solids of the feed water. It can be used as the concentrated product or as a dilution, as it is fully miscible with water in all proportions.

#### **Product benefits**

Effective dispersion of the iron oxides and silica salts.

Liquid product, easy to use.

All ingredients are FDA approved.
